

Problem – Solution Fit

Project: Automated Network Request Management (ServiceNow)

1. Problem Statement (Recap)

Employees and teams have no standardized, trackable way to request network changes or access, resulting in delayed fulfillment, inconsistent manager approval, and no visibility into network capacity, security review status, or change risk — creating friction for employees, managers, and the IT/Network support team.

2. Who Experiences This Problem

Persona	Pain Experienced
Employee	No guided way to request network access/changes; no visibility into status
Manager	Ad-hoc approval requests via email/verbal, no audit trail
IT / Network Team	Inconsistent request details, no structured task queue

3. Proposed Solution (Summary)

A ServiceNow Service Catalog item that captures a structured network access/change request, automatically routes it to the requester's manager for approval, creates a fulfillment task for the Network/IT Support team upon approval, and automatically raises an Incident if the request cannot be fulfilled (e.g., capacity or security policy conflict).

4. Problem–Solution Fit Analysis

Problem	How the Solution Addresses It
No standard request channel	Service Catalog item provides one consistent, guided entry point
No visibility into request status	Requested Item state (Requested → Approved/Rejected → In Progress → Closed) is trackable in My Requests
Inconsistent manager approval	Flow Designer automatically routes every request to the correct manager via My Approvals, with a permanent record
No structured fulfillment tracking	Approved requests auto-generate a Catalog Task assigned to the Network/IT Support team
No handling of capacity or security conflicts	Business Rule automatically raises an Incident when a request is placed On Hold due to a capacity or security policy conflict

5. Validation Approach

- Walkthrough demo with a sample employee, manager, and IT/Network team member (impersonation-based testing on the PDI).
- Confirm each functional requirement (FR-01 to FR-10) is satisfied end-to-end.
- Gather feedback on the request form's clarity and the approval experience.

6. Fit Conclusion

The proposed ServiceNow-based solution directly addresses each identified pain point using native platform capabilities (Service Catalog, Flow Designer, Business Rules, Approvals), confirming a strong problem–solution fit without requiring custom infrastructure or third-party tools.
