

Proposed Solution

Project: Automated Network Request Management (ServiceNow)

1. Solution Overview

A ServiceNow-based, data-driven workflow that lets employees request network access or changes (VPN access, firewall rule updates, new connectivity, guest access) through the Service Catalog. Requests are automatically routed to the employee's manager for approval, approved requests generate a fulfillment task for the Network/IT Support team, and unfulfillable requests (e.g., capacity or security policy conflict) automatically raise an Incident.

2. Objectives

- Replace informal, email-based network requests with a structured, trackable process.
- Provide managers a single, standard interface (My Approvals) to review and decide on requests.
- Give the IT/Network team a clear, assigned fulfillment task for every approved request.
- Automatically flag and escalate requests that cannot be fulfilled due to capacity or security policy constraints.

3. Solution Components

Component	Role in the Solution
Service Catalog Item	Captures the request: Request Type (VPN Access, Firewall Rule, New Connectivity, Guest Access), Business Justification, Device/System, Network Segment, Required By Date
Requested Item (sc_req_item)	Core record tracking status through the full lifecycle
Flow Designer (Approval Flow)	Routes the request to the Manager, branches on Approved/Rejected, triggers downstream actions
Catalog Task (sc_task)	Assigned to the Network/IT Support team upon approval, for actual implementation
Business Rule	Automatically raises an Incident when a request is placed On Hold due to capacity or security policy conflict
Email Notifications	Keep the employee informed at each key stage

4. End-to-End Flow

1. Employee submits the request via the Service Catalog.
2. Request is automatically routed to the employee's Manager for approval (My Approvals).
3. If Approved: a Catalog Task is created for the Network/IT Support team; employee is notified.
4. If Rejected: employee is notified with the reason; no further action taken.
5. If the request cannot be fulfilled (e.g., On Hold due to capacity or security policy conflict): an Incident is automatically raised for the Network Support group.

5. Benefits

- Faster turnaround — no more requests lost in email threads.
- Full auditability — every decision and status change is timestamped.
- Reduced manual effort for both managers and the IT/Network team.
- Proactive escalation of capacity or security conflicts instead of silent failures.

6. Alignment with Requirements

This solution directly satisfies the Functional Requirements (FR-01 through FR-09) and Non-Functional Requirements defined in the Solution Requirements document, using only native ServiceNow capabilities — no external tools or custom infrastructure required.
