

Performance Testing

Project: Automated Network Request Management (ServiceNow)

1. Objective

To verify that the Network Request Management solution — the Service Catalog form, Approval Flow, and Business Rules — performs reliably and responsively under normal and moderately increased usage, without errors or unacceptable delays.

2. Scope

- Service Catalog item load and form submission time
- Flow Designer execution time (trigger → Ask For Approval → branch actions)
- Business Rule execution time (Incident auto-creation on capacity/security policy conflict)
- Behavior under multiple concurrent request submissions

3. Test Environment

Component	Detail
Platform	ServiceNow Personal Developer Instance (PDI)
Test Data	Multiple simulated employee/manager test users
Tools	Flow Designer Execution Log, manual timed submissions

4. Performance Test Cases

ID	Test Case	Expected Result	Result
PT-01	Catalog item form loads with all variables	Loads within 2 seconds	Pass
PT-02	Single request submission end-to-end (submit → approval record created)	Approval record created within 5 seconds of submission	Pass
PT-03	5 concurrent requests submitted by different test employees	All 5 generate correct, independent approval records with no data cross-over	Pass
PT-04	Manager approves a request from My Approvals	Status updates and email/notification fires within 5 seconds	Pass
PT-05	Business Rule fires on state change to On Hold	Incident created within 3 seconds, no duplicate incidents	Pass

5. Observations

- Flow execution consistently completed without timeout across all test runs.
- No performance degradation observed with concurrent submissions in this testing scale (PDI-level load).
- Business Rule execution added negligible overhead to the overall request lifecycle.

6. Conclusion

The solution performs reliably within the tested scope. Given this is a Personal Developer Instance used for a student/portfolio project, testing was conducted at a small concurrent-user scale; full enterprise-scale load testing would be a recommended next step before any production deployment.
