

Empathy Map Canvas

Project: Automated Network Request Management (ServiceNow)

Persona: The Requesting Employee

A full-time employee or team member who needs network access or a network change (e.g., VPN access, firewall rule, new connectivity) to complete their assigned work.

THINK & FEEL "I hope this doesn't take weeks like last time." Worried the request will get lost in someone's inbox. Frustrated not knowing who to even ask, or which team owns it. Wants to look competent to their manager, not stuck waiting on IT/Network.	SEE Colleagues struggling with the same informal request process. No dashboard or tracker showing request status. Deadlines approaching that depend on this network access/change. Network/IT team appears busy and hard to reach.
SAY & DO Sends an email or Slack message to IT/Network or manager asking for access. Follows up repeatedly asking "any update?" Asks colleagues informally if they know the process. Sometimes escalates to their manager to speed things up.	HEAR "Let me check and get back to you." "Network is swamped right now." Colleagues complaining about similar delays. Manager asking "did you get that access sorted yet?"

Pain Points

No visibility into request status Unclear who approves the request No confirmation of receipt Delays with no explanation

Gains (What Would Make This Better)

A simple guided form to submit the request in minutes Automatic routing to the correct manager for approval Real-time status tracking (Requested / Approved / In Progress / Closed) Email confirmation at each stage of the process
