

User Acceptance Testing – FSD

Project: Automated Network Request Management (ServiceNow)

1. Purpose

This Functional Specification Document (FSD) defines the scenarios that must be validated by end users (Employee and Manager personas) to confirm the Network Request Management solution meets business expectations before being considered complete.

2. Scope

Covers the complete request lifecycle: submission, approval routing, approval decision, fulfillment task creation, and capacity/security-conflict escalation.

3. UAT Scenarios

ID	Scenario	Acceptance Criteria	Persona
UAT-01	Submit a network access/change request	Employee can complete and submit the catalog form with all required fields in under 2 minutes	Employee
UAT-02	Track request status	Employee can view the current status of their request via My Requests	Employee
UAT-03	Receive approval task	Manager sees the pending request under My Approvals with correct request details	Manager
UAT-04	Approve a request	Request status updates to Approved; a fulfillment task is created; employee is notified	Manager
UAT-05	Reject a request	Request status updates to Rejected; employee is notified with the reason provided	Manager
UAT-06	Capacity/security conflict handling	Request placed On Hold automatically raises an Incident assigned to Network Support	System
UAT-07	Fulfillment visibility	Network/IT Support team sees the task with correct assignment and request details	IT Team

4. Entry Criteria

All development, unit, and integration testing is complete; the Flow is Activated/Published; test users (Employee, Manager) are configured with correct Manager relationships.

5. Exit Criteria

All UAT scenarios (UAT-01 to UAT-07) pass without critical defects; any minor issues are logged and accepted by the project stakeholder (project guide/mentor).

6. Sign-off

Upon successful completion of all scenarios, this document, together with the UAT Report, serves as formal confirmation that the solution meets business requirements and is ready for demonstration/submission.
