

Customer Journey Map

Project: Automated Network Request Management (ServiceNow)

Persona: Employee requesting network access or a network change.

Stage	Awareness	Request Submission	Waiting for Approval	Approval Decision	Fulfillment	Closure
Doing	Realizes they need network access or a change (e.g., VPN, firewall rule, new connectivity) to do their job	Opens Service Catalog, fills out the network request form	Checks status occasionally, may follow up informally	Manager reviews request in My Approvals; approves or rejects	IT/Network team implements the change per the fulfillment task	Employee confirms access/connectivity is working
Thinking	"Who do I even ask for this?"	"I hope I filled this out correctly."	"Has anyone even seen my request yet?"	"Is this a reasonable, secure request to approve?"	"When will this actually be implemented?"	"Finally — now I can get back to work."
Feeling	Uncertain	Hopeful	Anxious / Impatient	Focused / Responsible	Expectant	Relieved / Satisfied
Touchpoint	Word of mouth, IT documentation	Service Catalog form	My Requests (self-service portal)	My Approvals	Catalog Task (sc_task)	Email notification, Requested Item status
Pain Point	No clear starting point for the request	Unclear which fields matter, no confirmation	No visibility into where the request is stuck	No context on urgency, business need, or security risk if not captured well	No estimated completion time communicated	No explicit closure notification in some cases
Opportunity	Promote the catalog item so employees know it exists	Guided, mandatory fields prevent incomplete requests	Real-time status field visible on the request	Business Justification / Risk variable gives approver context	Task with clear assignment group and required-by date	Automated approval/rejection and completion emails
