

Solution Requirements

Project: Automated Network Request Management (ServiceNow)

1. Functional Requirements

ID	Requirement	Priority
FR-01	System shall provide a Service Catalog item for employees to request network access or a network change.	Must Have
FR-02	System shall capture Request Type (VPN Access, Firewall Rule, New Connectivity, Guest Access), Business Justification, Device/System, Network Segment, and Required By Date.	Must Have
FR-03	System shall automatically route each request to the requester's Manager for approval.	Must Have
FR-04	Manager shall be able to approve or reject the request from the standard My Approvals interface.	Must Have
FR-05	On approval, system shall automatically create a fulfillment task assigned to the Network/IT Support team.	Must Have
FR-06	On rejection, system shall notify the employee with the rejection reason.	Must Have
FR-07	System shall automatically raise an Incident when a request cannot be fulfilled due to capacity or security policy conflict.	Should Have
FR-08	System shall send email notifications to the employee at each key stage (approved/rejected).	Should Have
FR-09	Employees shall be able to track the status of their own requests via My Requests.	Should Have
FR-10	System shall restrict visibility of requests based on role (employee sees own, manager sees team's).	Could Have

2. Non-Functional Requirements

Category	Requirement
Usability	The request form should be completable by a non-technical employee in under 2 minutes.
Performance	Approval routing should occur within seconds of request submission (asynchronous Flow execution).
Reliability	Every submitted request must reach an approver — no request should be silently lost.
Security	Only the assigned manager should be able to approve/reject a given request (role/ACL-based access); network changes must respect existing security policy.
Auditability	Every approval decision and status change must be timestamped and traceable.
Maintainability	Business logic should be implemented via reusable Business Rules and Flow Designer, avoiding hardcoded values.

3. Assumptions

- Every employee has a valid Manager set on their User record.
- The organization uses a single, standard Service Catalog (no multi-catalog complexity).
- Network capacity and security policy checks are handled at a basic level (On Hold state + Incident), not a full network inventory/security scanning system in this phase.

4. Out of Scope (Current Phase)

- Automatic network capacity or IP address inventory deduction/tracking.

- Integration with external network management or firewall automation tools (e.g., Cisco ISE, Palo Alto Panorama).
- Multi-level approval chains (only single-manager approval is in scope).
